→ Multilayer Perceptron Notation (MLP) Day-8

Backpropagation algorithm to train MLP.

i) finding no: of trainable parameters (total no. of weights & bias)

ii) How to denote that parameters

i/p layer (L0) | hidden layer 1 (L1) #1 | hidden layer 2 (L2) #2 | output layer (L3)

SRS

Data → {M x n}

M → #rows

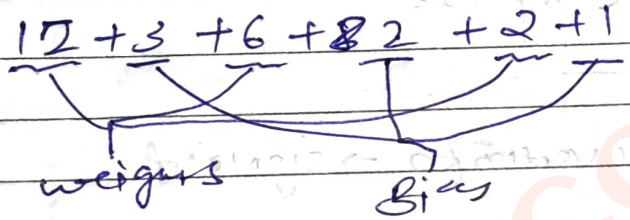

n = 4

each row denoted by X_i

i	1	2	3	4	$\hat{y}$

→ fist we ~~find~~ find the no. of trainable parameter

4 node x 3 node = 12 weights

→ How to denote weight and bias [w b]

b_{ij} → for bias where i = layer
j = node

→ How to denote output

O_{ij} → output → where i = layer
j = node

→ How to denote weight

W_{ij}^{k} → for weight where

i = from where it start (origin) node { कौन node से निकल रहा है
j = where it goes (destination) node { कौन node में जा रहा है
k = which layer it is going
