SdS

→ Multilayer Perceptron Intuition

The problem

→ perception with sigmoid

$$z = w_1 \text{cgpa} + w_2 \text{iq} + b$$

$$5 \times 8.7 + 10 \times 9.7 + 3 = z \Rightarrow \frac{1}{1+e^{-z}} = 0$$

$$P(y) = 0.8$$

→ As we go away from the line in positive direction then probability of happening increases.

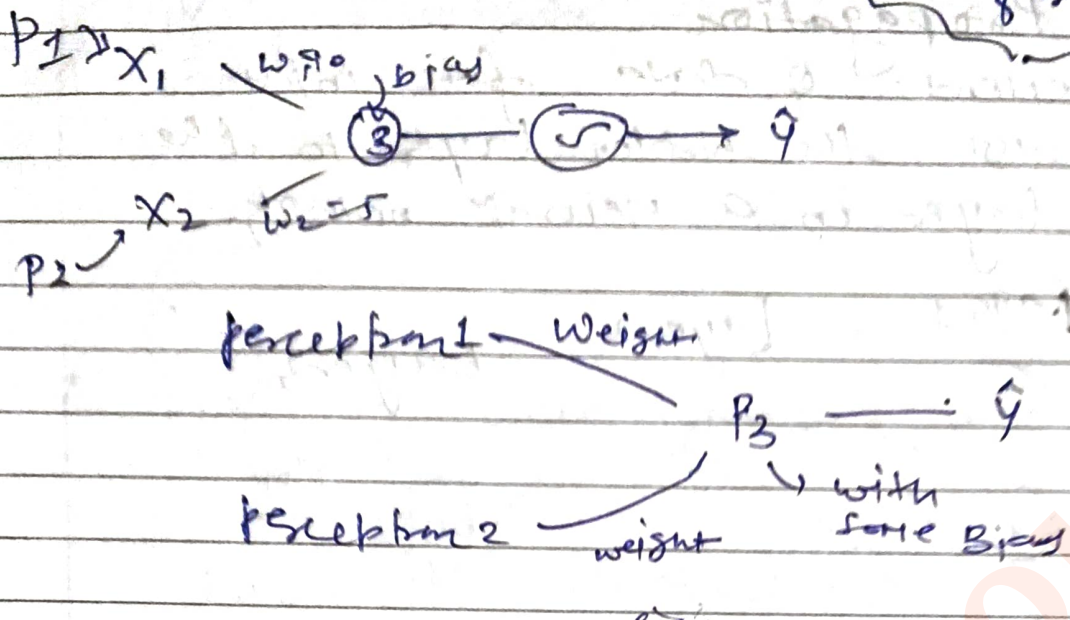

→ we superimpose two (or more) perceptron with each other then we perform smoothing then we got our model (desired output)

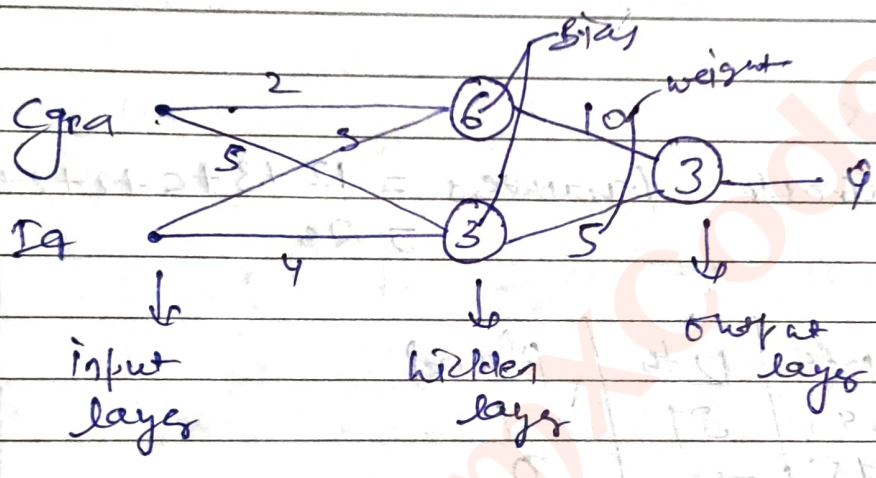

→ we finding the use linear combination of two perceptron to find out new probability

SdS

{ TensorFlow playground for visual understanding

→ Architecture means how ~~that~~ the nodes (perceptron) is connected with each other.

→ How to change our architecture (Neural layer architecture)

→ Adding nodes in hidden layer

→ Adding nodes in input layer

→ Adding nodes in output node

↳ we use where we need Multiclass classification eg: image classification (dog, cat, cow)

→ Deep Neural Network, (increase no. of hidden layers)
